Aditya Sahoo

Wireframe

A wireframe document is a visual guide that outlines the basic structure and layout of a webpage, application, or any digital interface before the design and development stages. It serves as a low-fidelity representation of the user interface, focusing on the placement of elements, navigation, and overall page structure. Wireframes are used in the early stages of a project to communicate design concepts and ensure alignment among stakeholders.

This wireframe document serves as a guide for designers and developers, providing a clear outline of the essential elements on each page without specifying detailed design elements.

Visual tools can be used to create a more detailed and visually appealing representation of these wireframes during the design phase.

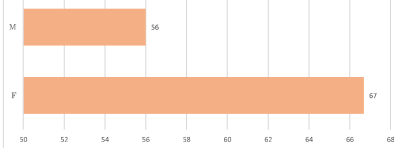

Creating a wireframe document involves visualizing the basic structure and layout of the user interface. Below is a simplified wireframe document for an HR Analytics Absenteeism project.

HR ANALYTICS ABSENTEEISM DASHBOARD

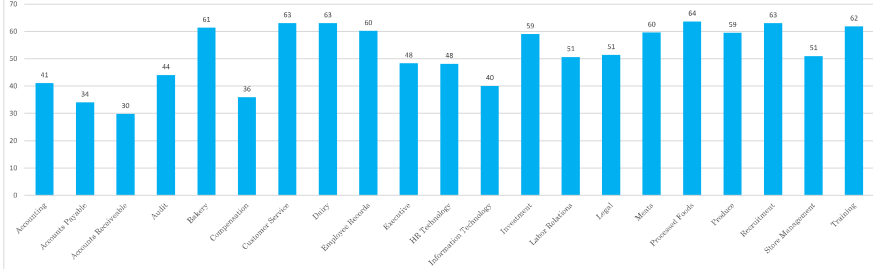

Total Absent Hours By Gender

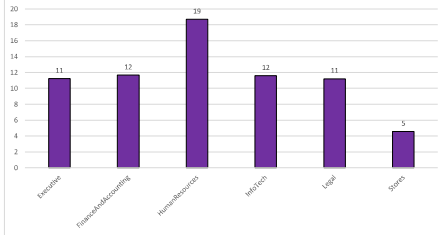

Average Absent Hours By Gender

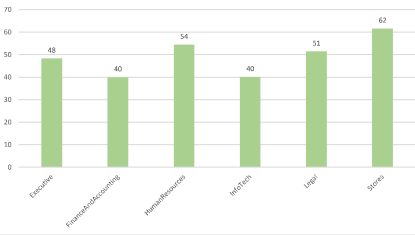

Department Wise Average Absent Hours

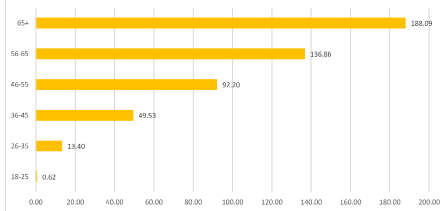

Division Wise Average Length of Service
